LUDELLUDGIS SEQUENTING AT USE JOINEY CERT.

available on the World Wide Web.

(URL, http://www.sanger.ac.uk/Projects/M_tuberculosis/) CDS have been renumbered from the original cosmid submissions but the old been renumbered from the original cosmid submissions but the old peen rediction was based on a Hidden Markov Model of TH genes implemented in TBparse (Krogh) supplemented with visual inspection of positional base preference in codons, especially where there is an increase in the observed/expected third position G + CAUTION: In some cases we may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, gtg, or ttg) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  IDGVKEPPGPAALVPVGGATMLMILAGANRQCHPGTRDRELPLUNRILLATAPLVALGAMA

Trust Genome Campus, Hinxton, Cambridge CB10 1SA Unite de Genetique Moleculaire Bacterienne, Institut Pasteur, 28 rue du Docteur Roux, 75724 paris Cedex 15, France E-mail: parkhill@sanger.ac.uk on Jun 27, 1998 this sequence version replaced gl:1409752.
                                                                                                                                               Details of M. Luberculosis sequencing at the Sanger Centre are available on the World Wide Web.

(Wile, http://www.sanger.ac.uk/Projects/M_tuberculosis/) GDS have been renumbered from the original cosmid submissions but the old gene designations are in brackets after the new gene numbers. Gene prediction was based on a Hidden Markow Model of TH yeues implemented in Tbyarse (Kroqh) supplemented with visual inspection of positional base preference in codons, especially where there is an increase in the observed/expected third position 6 + C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /_ore="Rv0085, (MTCY251.03), len: 220. hycP, similar to

                                                                                                                                                                                                                                                                                                                                                                                                                  CAUTION: In some cases we may not have predicted the currect initiation codon. Where possible we choose an initiation codon day, quy, or tupy which is preceded by an upstream ribosome binding site sequence (optimally 5-13pp before the initiation codon). It this cannot be identified we choose the most upstream
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /qene-"hycD"

Unknown membrane protein, contains PS00402 Binding-protein-dependent transport systems inner membrane comp signature. Some similarity to AL021930 [MTV035_18 Mycobacterium tuberculosis (472 aa) fasta score, opt: 429 %-score: 488 4 E(): 1.1e-19; 28.2%identity in 479 aa overlap"
URL, http://www.sanger.ac.uk/Projects/M_tuberculosis/) CDS have been renumbered from the original cosmid submissions but the old gene designations are in brackets after the new gene numbers. Gene prediction was based on a Hidden Markov Model of TB genes implemented in TBparse (Krogh) supplemented with visual inspection of positional base preference in codons, especially where there is an increase in the observed/expected third position G 'C CAUTION: In some cases we may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atq., grg, or ttg) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /gene="Rv3448"

                                                            This DNA sequence comprises Mycobacterium bovis BCG deletion sequence BCGdelta3. A specific genetic deletion of this region results in an avirulence phenotype of the mycobacterium. 2 other deletion regions (see AAT3355) and AAT3356) have also been detected identification involved screening a BCG cosmid library with a radiolabeled probe obtained following DNA subtraction between virulent Mycobacterium tuberculosis H37Rv and avirulent BCG. The deletions provide useful markers for the identification of an avirulent, or a virulent, mycobacterial phenotype. Determination of an avirulence requires the detection of the presence or absence of the deletion; the deletions are detected either by detecting the presence or absence of deletion junctions (see AAT33538-46), or by detecting the presence or absence of the sequences contained within heletion pollonarides are used as companients of
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mycobacterium tuberculosis DNA sequence encoding mammalian cell entry

A DNA molecule (AAT33656) confers on Mycobacterium tuberculosis an ability to enter mammalian cells and to survive within macrophages. The encoded protein sequence is given in AAM02301. The DNA was obtd. by lighting M. tuberculosis genomic DNA fragments into pBluescript II vector and screening recombinant E. coli strains for HeLa cell-
                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
The isolated DNA molecule of the invention confers on M. tuberculosis an ability to enter cells and to survive within macrophages. It encodes a polypeptide having a mol. wt. of about 50-55 kDa, pref. 52 kDa. The Ah sequence represents a highly hydrophilic protein with a hydrophobic region at its carboxy terminus. It could be a serveted protein, a cytoplasmic protein, or a surface protein with its carboxy terminus attached to the outer membrane of the organism. The deduced AA sequence is in AAR71931.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNA giving M. tuberculosis ability to enter mammalian cells and/or survive within macrophage(s), useful in vaccines to protect mammals against Mycobacterium tuberculosis infection

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence encodes a Mycobacterium tuberculosis cellular uptake protein fragment, which confers on M. tuberculosis an ability to enter mammalian cells and to survive within macrophages. The protein can be used in a vaccine to prevent M. tuberculosis infection, and provide for the uptake in cells of e.g. antibiotics, DNA fragments or anti-neoplastic agents. Antibodies raised against it can be used to treat mammals already exposed to M. tuberculosis, to induce a passive immunity and prevent disease

These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides the protein and coding sequences of novel

antipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; thrombolytic; communosuppressant; antimunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antilidabetic; hypotensive; dermatological; immunosuppressive; antilidabetic; hypotensive; dermatological; immunosuppressive; antilidabetic; antithyroid; and antibacterial; antiviral; antiliungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an OKEX-associated disorder. The nucleic acids can be used to express OREX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, vectors.

The present invention describes primer sets for synthesising 5602 [111]-length charks defined in the specification. Where a primer set comprises: (a) an oliqued primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises a least 15 nucleotides; or (b) a combination of an oligonucleotide comprises a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 1'-end sequence of an oligonucleotide comprises at least 15 nucleotides where the oligonucleotide comprises at selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length convas. The primers are also useful for the particularly without any specialised methods. And 1816 to AAMI18628 and AAMI3633 to AAMI3632 to AAMI3629 to AAMI3632 to AAMI3632 to AAMI3632 to AAMI3629 to AAMI3632 to AAMI3632 to AAMI3632 to a feature of the process the process and an amino acid sequences; and AAMI3629 to AAMI3632 to a feature of the process the process and an anino acid sequences; and an are used in the exemplification of the process the process and an anino acid sequences; and an account and account and anino acid sequences; and an account and account and account account and account account and account and account account and account account and account account anead in the exemplification.

These infections include human immunodeficiency virus (HIV), herpestineses, mycobacteria, Leismania spp., malaria and candidasis. The professes, mycobacteria, Leismania spp., malaria and as connective tissue disease, multiple sclerosis, systemic lupus crythomatosis, the una foid arthritis, autoimmune pulmonary inflammation, duillain-Barre syndrome, autoimmune thyroiditis, insulin dependent diabetics mellitus, myasthenia quavis, graft-versus-host-disease and autoimmune inflammatory eye disease. The proteins can also be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     982 nucleotide sequences isolated from the Enterococcus faecalis genome. AAX12938 to AAX13919 represent these nucleotide sequences which are primary uncleotide sequences, also known as contigs. The computer-based system can identify fragments of the Enterococcus faecalis qenome with commercial importance. The products can be used to detect the presence
                                      which the protein is preferentially expressed, as molecular weight, markers on Southern gels, and as chromosome markers or trags to identity chromosomes or to map gene positions. The proteins can be used in the treatment of immune deficiencies and disorders, such as severe combined
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A computer readable medium has been developed which has recorded on it
animals. The polynucleotides can be used as markers for tissues in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        autoimmune inflammafory eye disease. The proteins can also be used to treat affergie conditions, such asthma. AAA16698 to AAA16774 represent

                      t
of Enterococcus faecalis in samples. They can also be used for diagnosing Enterococcal infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus taecalis, or another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecalis nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcus!

homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypoptide production, e.g. in E. colf bosts.
The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori lite cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping conties generaled by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted cycling regions defined by computer evaluation. To identify likely H. pylori and idens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Helicobacter pylori nucleic acid sequences and related polypeptide(s) - useful for vaccines to treat or prevent H. pylori infection, and to detect Helicobacter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cytoplasmic, vaccine; prevention; treatment; infection; envelope; identification; binding compound; bacterium; life cycle; activator; bacteria; inhibitor; duodenal ulcer disease; chronic gastritis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a Moraxella catarrhalis genomic library comprising of a combination of 41 nucleic acid molecules (see AARF2854). The library has a number of uses described in the specification e.g. is useful for aidentifying diagnostic and therapeutic compositions. M. catarrhalis (Branhamella catarrhalis) is a large aerobic. gram-negative diplococcus, normally found among the bacterial flora of human upper airways. M. catarrhalis is known to cause acute. localised infections such as olitis media, sinusitis and bronchopulmonary infection and life-threatening, systemic diseases including endocarditis
useful as potential H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Genomic library; bacteria; human upper airway; otitis media: sinusitis; bronchopulmonary; endocarditis; meningitis; ss.

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atheroselenosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thrombosmbolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPs shown in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atheroselerosis; stroke; venous thromboembolism;

Xylanases the efficiency of digestion and assimilation of nutrients. Xylanases are preferred alignment added during the feed pelleting process. To survive the pelleting process and to have optimum activity in the animal, the ylandse needs to have high thermostability with optimum activity at physiological pul and temperature. Various xylanases have some properties suitable for feed applications but they lack the thermostability required to survive food pelleting. The present sequence is oligonucleotide, XyTv-104, from Trichoderma reesie. This sequence is oligonucleotide, XyTv-104, from Trichoderma reesie. This sequence was used along with 17 other overlapping oligonucleotides to construct the coding sequence for Trichoderma reesie xylanse Trx. The other oligonucleotides were:

                                                           The present sequence appears in the specification, which describes a method for modifying a Family II xylanase to improve its thermophilicity, alkalophilicity and or thermotolerance. This method comprises modification of amino acids 10, 27 or 29 of Trichoderma recess; xylanase
                                                                                                                                                                                                             If or corresponding displaced amono acids of another Family II xylanase, replacement of one of more amono acid sequences in the N-terminal region with corresponding aligned acqueres from another Pamily II xylanase to form a chimeric xylanase and/on upstream extension of the N-terminal by addition of upto 10 amino acids. The modified xylanses are useful for improving the bleechability of wood pulp by treatment at 55-75 degrees celsins and pH 7.5-9.0 for 5-180 minutes. They might also be useful as digestibility-improving animal feed additives. They might also be useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
